Section 1

The Sry Hotel Booking System is a comprehensive management database designed to handle hotel operations, ranging from guest registration to room management and financial tracking. It utilizes a relational structure to ensure that guests, rooms, and payments are accurately linked.

Entities:

1. **1.accounts**
   - Purpose: Stores user information and determines access levels through roles.
     - Primary Key: account_id
     - Attributes: first_name, last_name, email, contact, username, password, account_status, and role (Admin, FrontDesk, or Guest).
2. **2. room_type**
   - Purpose: Defines categories of rooms available in the hotel.
     - Primary Key: room_type_id
     - Attributes: type_name, description, capacity, and price_per_night.
3. **3. rooms**
   - Represents the individual physical rooms available for booking.
     - Primary Key: room_id
     - Foreign Key: room_type_name (references room_type_id)
     - Attributes: room_number, floor, room_picture(might), status (e.g., Available, Occupied), and description.
4. **4. bookings**
   - Records the central data that links guests to their stays.
     - Primary Key: bookings_id
     - Foreign Keys: * account_id (references accounts)
       - room_id (references rooms)
     - Attributes: check_in, check_out, total_night, total_price, and booking_status (Booked or Cancelled).
5. **5. payments**
   - Handles the financial transactions associated with a booking.
     - Primary Key: payment_id
     - Foreign Keys: * account_id (references accounts)
       - booking_id (references bookings)
     - Attributes: amount, payment_method, payment_status (Paid or Pending), and payment_date.
